

BOUNDED ARCHITECTURE STUDY

1

Bounded study scope

question, baseline, design space, constraints, and intended decision

2

Architectural claim under review

mechanism, expected effect, scope, and defeat conditions

3

Representation + tools + environment

encoded state, valid actions, observations, and tool path

4

Execution + analysis mechanism

design loop when work iterates; method roles compose as needed

5

Evidence + accountable review

results, provenance, uncertainty, rejection checks, and decision authority

revise claim
or study

bounded finding or architectural decision
